s2394480

David Vroom
s2309939

November 21, 2017

Exercise 1

Attain some familiarity with the way functions are selected from namespaces

We used the following code,

main.cc

```
1 #include <iostream>
2
3 namespace First
4 {
5     enum Enum
6     {};
7
8     void fun(First::Enum symbol)
9     {
10         std::cout << "First::fun called\n";
11     }
12 }
13
14 namespace Second
15 {
16     void fun(First::Enum symbol)
17     {
18         std::cout << "Second::fun called\n";
19     }
20 }
```

71
82
83
84
75
87

```

21 |
22 | int main()
23 | {
24 |     First::Enum symbol;
25 |
26 |     fun(symbol);           // First::fun called
27 | }

```

Call fun and explain why First::fun is called. How would you call Second::fun instead?

Als een functie uit een namespace wordt aangeroepen zonder de namespace te specificeren, dan wordt de namespace van het argument van de functie gebruikt om de namespace van de functie te bepalen; het zogenaamde 'Koenig Lookup'. Aangezien het argument is gedeclareerd als type First::Enum wordt First::fun aangeroepen. Om Second::fun aan te roepen moet de namespace expliciet worden genoemd: Second::fun(symbol).

In the namespaces slides (#6) it is stated that operator<<'s use is simplified because of the Koenig lookup. Explain.

Zonder Koenig lookup zal de korte versie std::cout << "Hello" (net als de lange versie operator<<(std::cout, "Hello")) niet gebruikt kunnen worden. De insertion operator functie uit de standard namespace is dan niet bereikbaar zonder expliciete functie call std::operator<<(std::cout, "Hello") voor zowel de korte als de lange versie.

Now, just above main, declare a function void fun(First::Enum symbol). Compile this program. What happens? Why?

Er ontstaat een foutmelding vanwege ambiguïteit. De compiler weet nu niet of hij de functie uit de namespace First of de globale functie net boven main moet aanroepen.

Waarom niet? Wordt K-lookup hier dan niet gebruikt?

82

Exercise 2

Learn why streams can be used to determine the truth values of conditions, but not to assign values to bool variables.

Note: The code given in the exercise is incomplete, and therefore won't compile even without the intended mistake. So first of all we state the following code as a starting point:

header.ih

```
1 | #include <iostream>
2 | #include <string>
3 |
4 | using namespace std;
5 |
6 | bool promptGet(istream &in, string &str);
7 | void process(string const &str);
```

main.cc

```
1 | #include "header.ih"
2 |
3 | int main()
4 | {
5 |     string str;
6 |     while (promptGet(cin, str))
7 |         process(str);
8 | }
```

process.cc

```
1 | #include "header.ih"
2 |
3 | void process(string const &str)
4 | {
5 |     cout << "processed: " << str << '\n';
6 | }
```

promptget.cc

```
1 | #include "header.ih"
2 |
3 | bool promptGet(istream &in, string &str)
4 | {
5 |     cout << "Enter a line or ^D\n";      // ^D signals end-of-input
6 |
7 |     return getline(in, str);
8 | }
```

1. Why doesn't this work? (Explain why the error message is generated by the compiler)

This code doesn't work, because `getline(in, str)` cannot be returned as a `bool` in `promptGet`. This is because the class `istream` defines explicit operator `bool()` `const`. This allows the compiler to only perform a conversion to a `bool` when this is explicitly required (as in a `while` statement), but not implicitly (as in the `return` statement above).

2. Change `promptGet`'s body so that the code does compile.

By changing `promptGet`'s body in the following way, the code does compile:

promptget.cc

```
1 | #include "header.ih"
2 |
3 | bool promptGet(istream &in, string &str)
4 | {
5 |     cout << "Enter a line or ^D\n";      // ^D signals end-of-input
6 |
7 |     return static_cast<bool>(getline(in, str));
8 | }
```

3. Without changing `promptGet`'s body, change `promptGet` so that the code does compile.

By changing `promptGet` (and the declaration in the internal header) in the following way, the code does compile:

promptget.cc

```
1 | #include "header.ih"
2 |
```

```
3 | istream &promptGet(istream &in, string &str)
4 | {
5 |     cout << "Enter a line or ^D\n";      // ^D signals end-of-input
6 |
7 |     return getline(in, str);
8 | }
```

Exercise 3

Learn to implement index operators

The Matrix class that is used here, is derived from the solutions of exercise 64. Extensions to the class header made in upcoming exercises are also shown here.

We used the following code,

```
matrix/matrix.h

1 #ifndef INCLUDED_MATRIX_
2 #define INCLUDED_MATRIX_
3
4 #include <iosfwd>
5 #include <initializer_list>
6
7 class Matrix
8 {
9     size_t d_nRows = 0;
10    size_t d_nCols = 0;
11    double *d_data = 0; // in fact R x C matrix
12
13    // exercise 4
14    // =====
15    friend Matrix operator+(Matrix const &lhs, Matrix const &rhs); // 1
16    friend Matrix operator+(Matrix &&lhs, Matrix const &rhs); // 2
17
18    // exercise 5
19    // =====
20    friend std::ostream &operator<<(
21        std::ostream &out, Matrix const &matrix);
22    friend std::istream &operator>>(
23        std::istream &in, Matrix const &matrix);
24
25    size_t d_idxColStart = 0;
26    size_t d_idxRowStart = 0;
27    size_t d_nColEnd = d_nCols;
28    size_t d_nRowEnd = d_nRows;
29    std::istream &(Matrix::*d_extractMode)(
30        std::istream &in, Matrix const &matrix) const = &Matrix::extractRows;
```

143     return operatorIndex(index);
144 }
145
146 #endif

```

83

Exercise 4

Learn to implement and spot opportunities for overloaded operators

The header is shown in exercise 3, the implementations of the added functions are shown below:

```
matrix/add.cc
1 | #include "matrix.ih"
2 |
3 | void Matrix::add(Matrix const &rhs)
4 | {
5 |     if (rhs.d_nCols != d_nCols or rhs.d_nRows != d_nRows)
6 |     {
7 |         cerr << "Warning: Matrices have differnt size, "
8 |              "so cannot be added!\n";
9 |         exit(1);
10 |    }
11 |
12 |    for (size_t idx = size(); idx--; )
13 |        d_data[idx] += rhs.d_data[idx];
14 | }
```

```
matrix/operatoradd1.cc
1 | #include "matrix.ih"
2 |
3 | Matrix operator+(Matrix const &lhs, Matrix const &rhs)
4 | {
5 |     Matrix tmp{ lhs };
6 |     tmp.add(rhs);
7 |     return tmp;
8 | }
```

```
matrix/operatoradd2.cc
1 | #include "matrix.ih"
2 |
```

```

3 | Matrix operator+(Matrix &&lhs, Matrix const &rhs)
4 | {
5 |     lhs.add(rhs);
6 |     return move(lhs);
7 | }

```

matrix/operatorcompadd1.cc

```

1 | #include "matrix.ih"
2 |
3 | Matrix &Matrix::operator+=(Matrix const &other) &
4 | {
5 |     Matrix tmp{ *this };
6 |     tmp.add(other);
7 |     swap(tmp);
8 |     return *this;
9 | }

```

matrix/operatorcompadd2.cc

```

1 | #include "matrix.ih"
2 |
3 | Matrix Matrix::operator+=(Matrix const &other) &&
4 | {
5 |     add(other);
6 |     return move(*this);
7 | }

```

84

Exercise 5

Learn to insert/extract objects of your own class

Explain why implementing the extraction operator when using compilers that do *not* implement the c++-17 standard is more complex than implementing the extraction operators when using compilers that *do* implement the c++-17 standard

We don't know the answer to this question, and also could not find it in the lecture, annotations and the internet.

Also, we are aware that simply calling `mat(2,5)` does invalidate `mat`'s data with our code. We thought of making a proxy class and use a conversion operator to solve this, but we couldn't make it work. We would like some advice on this. However, the overloaded extraction and insertion operator of the `Matrix` object work properly.

The header is shown in exercise 3, the implementations of the added functions are shown below.

matrix/extractcols.cc

```
1 #include "matrix.ih"
2
3 std::istream &Matrix::extractCols(
4     std::istream &in, Matrix const &matrix) const
5 {
6     for (size_t colIdx = matrix.d_idxColStart;
7         colIdx != matrix.d_nColEnd;
8         ++colIdx)
9         for (size_t rowIdx = matrix.d_idxRowStart;
10            rowIdx != matrix.d_nRowEnd;
11            ++rowIdx)
12             in >> matrix.el(rowIdx, colIdx);
13     return in;
14 }
```

matrix/extractrows.cc

```
1 #include "matrix.ih"
2
```

broken promise
Also, this should be
a normal member,
In this form it ~~can~~
could be static,
which you didn't
(and isn't
necessary).

:-) Maybe you searched
for the wrong things?

95

by default you should
extract the full matrix.
What happens after

cin >> mat (small sub
matrix) ?
>> mat >> mat ?

```
3 std::istream &Matrix::extractRows(  
4     std::istream &in, Matrix const &matrix) const  
5 {  
6     for (size_t rowIdx = matrix.d_idxRowStart;  
7         rowIdx != matrix.d_nRowEnd;  
8         ++rowIdx)  
9         for (size_t colIdx = matrix.d_idxColStart;  
10            colIdx != matrix.d_nColEnd;  
11            ++colIdx)  
12             in >> matrix.el(rowIdx, colIdx);  
13     return in;  
14 }
```

same
extra.Cols

this
should
extract
the
full
matrix.

7         for (size_t colIdx = 0; colIdx != matrix.d_nCols; ++colIdx)
8             out << matrix.el(rowIdx, colIdx) << " ";
9         out << '\n'; // add newline after each row
10    }
11    return out;
12 }

```

extract mode returns an istream?

Exercise 7

Learn to implement and spot opportunities for overloaded operators

1.

The following two overloaded operators are added to compare two Matrix objects for (in)equality:

matrix/operatorequalto.cc

```
1 #include "matrix.ih"
2
3 bool operator==(Matrix const &lhs, Matrix const &rhs)
4 {
5     if (lhs.d_nCols != rhs.d_nCols or lhs.d_nRows != rhs.d_nRows)
6         return false;
7
8     for (size_t idx = lhs.size(); idx--; )
9     {
10         if (lhs.d_data[idx] != rhs.d_data[idx])
11             return false;
12     }
13     return true;
14 }
```

matrix/operatornotequalto.cc

```
1 #include "matrix.ih"
2
3 bool operator!=(Matrix const &lhs, Matrix const &rhs)
4 {
5     if (!(lhs == rhs))
6         return true;
7
8     return false;
9 }
```

// FLOW!

} why not
inline?

2.

We modified the following code of the Strings class to facilitate comparing for (in)equality,

```
strings/strings.h
1 #ifndef EX62_STRINGS_
2 #define EX62_STRINGS_
3
4 #include <iosfwd>
5
6 class Strings
7 {
8     friend bool operator==(Strings const &lhs, Strings const &rhs);
9     friend bool operator!=(Strings const &lhs, Strings const &rhs);
10
11     size_t d_size = 0;
12     size_t d_capacity = 1;
13     std::string **d_str;
14
15 public:
16     Strings();
17     Strings(int argc, char **argv);
18     Strings(char **environLike);
19     Strings(Strings const &outerStrings);    // copy constructor
20     Strings(Strings &&tmp);                  // move constructor
21
22     ~Strings();
23
24     // copy assignment operator
25     Strings &operator=(Strings const &outerStrings);
26     // move assignment operator
27     Strings &operator=(Strings &&tmp);
28
29     void swap(Strings &other);
30
31     size_t size() const;
32     size_t capacity() const;
33     std::string const &at(size_t idx) const;
34     std::string &at(size_t idx);
35
36     void add(std::string const &next);
```

slippy:
SF

```

36
37     void resize(size_t newSize);
38     void reserve(size_t newCapacity);
39
40     private:
41         std::string &safeAt(size_t idx) const; // private backdoor
